RFC 9826

A YANG Data Model for the Path Computation Element Communication Protocol (PCEP)

Abstract

This document defines a YANG data model for the management of the Path Computation Element Communication Protocol (PCEP) for communications between a Path Computation Client (PCC) and a Path Computation Element (PCE), or between two PCEs.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <https://www.rfc-editor.org/info/rfc9826>.

1. Introduction

The Path Computation Element (PCE) defined in [RFC4655] is an entity that is capable of computing a network path or route based on a network graph and applying computational constraints. A Path Computation Client (PCC) may make requests to a PCE for paths to be computed.

PCEP is the communication protocol between a PCC and PCE; it is defined in [RFC5440]. PCEP interactions include path computation requests and path computation replies as well as notifications of specific states related to the use of a PCE in the context of Multiprotocol Label Switching (MPLS) and Generalized MPLS (GMPLS) Traffic Engineering (TE). [RFC8231] specifies extensions to PCEP to enable stateful control of MPLS-TE Label Switched Paths (LSPs). [RFC8664] and [RFC9603] extend PCEP to support Segment Routing in MPLS and IPv6, respectively.

This document defines a YANG 1.1 [RFC7950] data model for the management of PCEP speakers. It is important to establish a common data model for how PCEP speakers are identified, configured, and monitored. The data model includes configuration data and state data.

This document contains a specification of the PCEP YANG module "ietf-pcep", which provides the PCEP [RFC5440] data model. Further, this document also includes the PCEP statistics YANG module "ietf-pcep-stats", which provides statistics, counters, and telemetry data.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA) [RFC8342]. The origin of the data is indicated as per the origin metadata annotation.

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. Terminology and Notation

This document uses the terminology defined in [\[RFC4655\]](#) and [\[RFC5440\]](#). In particular, it uses the following:

- Path Computation Request (PCReq) message
- Path Computation Reply (PCRep) message
- Path Computation Notification (PCNtf) message
- Path Computation Error (PCErr) message
- Request Parameters (RP) object
- Synchronization Vector (SVEC) object
- Explicit Route Object (ERO)

This document uses the following terms defined in [\[RFC7420\]](#):

PCEP entity: a local PCEP speaker

PCEP peer: a remote PCEP speaker

PCEP speaker: term used when it is not necessary to distinguish between local and remote.

Further, this document uses the following terms defined in [\[RFC8051\]](#):

- Stateful PCE
- Passive Stateful PCE
- Active Stateful PCE
- Delegation

In addition, this document uses the following terms defined in [\[RFC8231\]](#):

- Revocation
- Redelegation
- Path Computation LSP State Report (PCRpt) message
- Path Computation LSP Update Request (PCUpd) message
- PLSP-ID (a PCEP-specific identifier for the LSP)
- Stateful PCE Request Parameter (SRP)

This document also uses the following terms defined in [\[RFC8281\]](#):

- PCE-initiated LSP
- Path Computation LSP Initiate (PCInitiate) message

Last, this document uses the following terms, which are defined in the RFCs indicated below:

- Path Setup Type (PST) [[RFC8408](#)]
- Segment Routing (SR) [[RFC8664](#)]
- Objective Function (OF) [[RFC5541](#)]
- Association [[RFC8697](#)]
- Configuration data [[RFC6241](#)]
- State data [[RFC6241](#)]

3.1. Tree Diagrams

Simplified graphical representations of the data model are used in this document. The meaning of the symbols in these diagrams is defined in [[RFC8340](#)].

3.2. Prefixes in Data Node Names

In this document, the names of data nodes and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the corresponding YANG module, as shown in [Table 1](#).

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]
te-types	ietf-te-types	[RFC8776]
key-chain	ietf-key-chain	[RFC8177]
nacm	ietf-netconf-acm	[RFC8341]
tlss	ietf-tls-server	[RFC9645]
tlsc	ietf-tls-client	[RFC9645]
ospf	ietf-ospf	[RFC9129]
isis	ietf-isis	[RFC9130]

Table 1: Prefixes and Corresponding YANG Modules

3.3. References in the YANG Data Model

The following table lists the documents that are referenced in the YANG data model defined in this document.

Documents	Reference
OSPF Protocol Extensions for Path Computation Element (PCE) Discovery	[RFC5088]
IS-IS Protocol Extensions for Path Computation Element (PCE) Discovery	[RFC5089]

Table 2: References in the YANG Data Model

4. The Design of PCEP Data Model

The PCEP YANG module defined in this document has all the common building blocks for PCEP, which are listed below and further detailed in the subsequent subsections.

- The local PCEP entity
- The PCEP peer
- The PCEP session
- Notifications
- RPC

```

module: ietf-pcep
  +--rw pcep!
    +--rw entity
      +--rw addr*                inet:ip-address-no-zone
      +--rw enabled?            boolean
      +--rw role                 role
      +--rw description?       string
      +--rw speaker-entity-id? string {sync-opt}?
      +--rw admin-status?      boolean
      +--ro index?             uint32
      +--ro oper-status?       oper-status

  | +--...
  +---n pcep-session-peer-overload
  | +--...
  +---n pcep-session-peer-overload-clear
  +--...

```

4.1. The Entity

The PCEP YANG module may contain status information for the local PCEP entity.

The entity has an IP address (using ietf-inet-types [RFC6991](#)) and a "role" leaf (the local entity PCEP role) as mandatory.

Note that the PCEP MIB module [RFC7420](#) uses an entity list and a system-generated entity index as a primary index to the read-only entity table.

The local PCEP entity contains various information related to this entity such as its domain, capabilities, security parameters, etc. When the local entity is PCE, it could also have path-key and the LSP Database (LSP-DB) information.

Note that the timer names in YANG use hyphens as compared to [RFC5440](#) (for example, DeadTimer in the protocol specification is called dead-timer in YANG).

```

module: ietf-pcep
  +--rw pcep!
    +--rw entity
      +--rw addr*                inet:ip-address-no-zone
      +--rw enabled?             boolean
      +--rw role                  role

4.1.1. The Peer List

The peer list contains peer(s) that the local PCEP entity knows about. A PCEP speaker is identified by its IP address. If there is a PCEP speaker in the network that uses multiple IP addresses, then it looks like multiple distinct peers to the other PCEP speakers in the network.

Since PCEP sessions can be ephemeral, the peer list tracks a peer even when no PCEP session currently exists for that peer. The statistics contained are an aggregate of the statistics for all successive sessions with that peer.

To limit the quantity of information that is stored, an implementation **MAY** choose to discard this information if and only if no PCEP session exists for the corresponding peer.

The data model for PCEP peers presented in this document uses a flat list of peers. Each peer in the list is identified by its IP address.

This peer list includes peers that are explicitly configured at the local PCEP entity as well as peers that are learned dynamically. For example, at a PCC, the remote PCE peer to use could be explicitly configured. A PCC could also learn a PCE address in the network via the IGP discovery, and it will show up in this list. When a session is initiated at a PCE, the remote PCC peer information is also added by the system to the peer list.

4.1.1.1. The Session List

The session list contains PCEP sessions that the PCEP entity (PCE or PCC) is currently participating in. The statistics in session are semantically different from those in peer since the former applies to the current session only, whereas the latter is the aggregate for all sessions that have existed to that peer.

Although [\[RFC5440\]](#) forbids more than one active PCEP session between a given pair of PCEP entities at any given time, there is a window during the session establishment where two sessions may exist for a given pair, one representing a session initiated by the local PCEP entity and the other representing a session initiated by the peer. When one of these sessions reaches the active state, then the other is discarded.

The data model for the PCEP session presented in this document uses a flat list of sessions. Each session in the list is identified by its initiator. This index allows two sessions to exist transiently for a given peer, as discussed above.

```

              {sync-opt}?

```

4.2. Notifications

This YANG data model defines a list of notifications to inform clients of important events detected during the protocol operation. The notifications defined cover the PCEP MIB [RFC7420] notifications.

```

notifications:
+---n pcep-session-up
| +--ro peer-addr?          -> /pcep/entity/peers/peer/addr
| +--ro session-initiator? leafref
| +--ro state-last-change? yang:timestamp
| +--ro state?             sess-state
+---n pcep-session-down
| +--ro peer-addr?          -> /pcep/entity/peers/peer/addr
| +--ro session-initiator? initiator
| +--ro state-last-change? yang:timestamp
| +--ro state?             sess-state
+---n pcep-session-local-overload
| +--ro peer-addr?          -> /pcep/entity/peers/peer/addr

| +--ro peer-overload-time? uint32
+---n pcep-session-peer-overload-clear
+--ro peer-addr?
| -> /pcep/entity/peers/peer/addr
+--ro peer-overloaded?      boolean
+--ro peer-overloaded-clear-timestamp? yang:timestamp

```

4.3. RPC

This YANG data model defines an RPC to trigger state resynchronization at the PCE for a sanity check with a particular PCC.

```

rpcs:
+---x trigger-resync {stateful, sync-opt}?
+---w input
+---w pcc -> /pcep/entity/peers/peer/addr

```

5. The Design of PCEP Statistics Data Model

The "ietf-pcep-stats" module augments the "ietf-pcep" module to include statistics at the PCEP peer and session level. It also includes an RPC to reset all PCEP statistics across all peers and sessions through mechanisms such as walking a list of pointers to those peer and session statistics.

If this mechanism is not supported, implementations must reset PCEP statistics by invoking the action 'reset-statistics' for each peer and session.

```

module: ietf-pcep-stats

augment /pcep:pcep/pcep:entity/pcep:peers/pcep:peer:

6. Advanced PCE Features

This document contains a specification of the base PCEP YANG module, "ietf-pcep", which provides the basic PCEP [RFC5440] data model.

This document further handles advanced PCE features such as:

- Capability and scope
- Domain information (local/neighbor)
- Path-key
- Objective Function (OF)
- Global Concurrent Optimization (GCO)
- Point-to-Multipoint (P2MP)
- GMPLS
- Inter-layer
- Stateful PCE
- Segment Routing (SR) for the MPLS data plane
- Authentication including PCEPS (TLS)
- Hierarchical PCE (H-PCE)

Segment Routing in the IPv6 data plane is out of the scope of this document. Refer to [YANG-PCEP-SRV6] for the PCEP-SRv6 YANG module.

6.1. Stateful PCE's LSP-DB

In the operational datastore of stateful PCE, the list of LSP state is maintained in the LSP-DB. The key is the PLSP-ID, the PCC's IP address, and the LSP-ID.

The PCEP data model contains the operational state of LSPs (/pcep/entity/lsp-db/lsp/) with PCEP-specific attributes. The generic TE attributes of the LSP are defined in [YANG-TE]. A reference to the LSP state in the TE model is maintained.

7. Other Considerations

7.1. PCEP over TLS (PCEPS)

[RFC8253] describes the use of TLS 1.2 [RFC5246] or later in PCEP. Further, [PCEPS-UPDATE] specifies how to protect PCEP messages with TLS 1.3 [RFC8446] by disallowing the use of early data (0-RTT) and listing the cipher suites that need to be supported with TLS 1.3.

The PCC acting as the TLS client opens the TLS connection, and the PCE acting as the TLS server listens for incoming connections as per the TLS specifications ([RFC8446] and [RFC5246]). [RFC8253] specifies the StartTLS procedure in PCEP that initiates the TLS connection before exchanging PCEP messages; thus, the identity verification is completed before the PCEP session is established.

Note that a PCEP speaker could act as both a client (PCC) and a server (PCE). The role within the context of a PCEP session is determined by the relationship it has with its peer (the same is true for TLS as well).

The YANG module uses the TLS grouping in [RFC9645]. Note that any TLS version can be configured, but [RFC9645] recommends the use of TLS 1.3 only. At the time of publication of this document, TLS 1.2 is still in common use for PCEP and can still be enabled with the feature "tls12" even though it is marked with status as "deprecated".

8. PCEP YANG Modules

8.1. ietf-pcep Module

```
<CODE BEGINS> file "ietf-pcep@2025-07-24.yang"

module ietf-pcep {
  yang-version 1.1;
  namespace "urn:ietf:params:xml:ns:yang:ietf-pcep";

<CODE ENDS>
```

9. Security Considerations

This section is modeled after the template described in [Section 3.7.1](#) of [\[YANG-GUIDELINES\]](#).

The "ietf-pcep" and "ietf-pcep-stats" YANG modules define data models that are designed to be accessed via YANG-based management protocols, such as NETCONF [\[RFC6241\]](#) and RESTCONF [\[RFC8040\]](#). These protocols have to use a secure transport layer (e.g., SSH [\[RFC4252\]](#), TLS [\[RFC8446\]](#), and QUIC [\[RFC9000\]](#)) and have to use mutual authentication.

The Network Configuration Access Control Model (NACM) [\[RFC8341\]](#) provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

The "ietf-pcep" YANG module:

There are a number of data nodes defined in the "ietf-pcep" YANG module that are writable/creatable/deletable (i.e., "config true", which is the default). All writable data nodes are likely to be reasonably sensitive or vulnerable in some network environments. Write operations (e.g.,

edit-config) and delete operations to these data nodes without proper protection or authentication can have a negative effect on network operations. The following subtrees and data nodes have particular sensitivities/vulnerabilities:

- /pcep/entity/: Configures local parameters, capabilities, etc.
- /pcep/entity/peers: Configures remote peers to set up a PCEP session.

Unauthorized access to the above list can adversely affect the PCEP session between the local entity and the peers. This may lead to the inability to compute new paths, and stateful operations on the delegated as well as PCE-initiated LSPs.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. Specifically, the following subtrees and data nodes have particular sensitivities/ vulnerabilities:

- /pcep/lsp-db: All the LSPs in the network. Unauthorized access to this could provide all path and network usage information.
- /pcep/path-keys/: The Confidential Path Segments (CPS) are hidden using path-keys. Unauthorized access to this could leak confidential path information.

Some of the RPC or action operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. Specifically, the following operation has particular sensitivities/ vulnerabilities:

- trigger-resync: Triggers resynchronization with the PCE. Unauthorized access to this could force a PCEP session into continuous state synchronization.

This YANG module uses groupings from other YANG modules that define nodes that may be considered sensitive or vulnerable in network environments. Refer to the Security Considerations of [\[RFC9645\]](#) and [\[RFC8776\]](#) for information as to which nodes may be considered sensitive or vulnerable in network environments.

The actual authentication key data (whether locally specified or part of a key-chain) is sensitive and needs to be kept secret from unauthorized parties; compromise of the key data would allow an attacker to forge PCEP traffic that would be accepted as authentic, potentially compromising the TE domain.

The model describes several notifications; implementations must rate-limit the generation of these notifications to avoid creating a significant notification load. Otherwise, this notification load may have some side effects on the system stability and may be exploited as an attack vector.

The "auth" container includes various authentication and security options for PCEP. Further, [Section 7.1](#) describes how to configure TLS 1.2 and TLS 1.3 for a PCEP session via this YANG module.

The "ietf-pcep-stats" YANG module:

There are no particularly sensitive writable data nodes.

There are no particularly sensitive readable data nodes.

Some of the RPC or action operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. Specifically, the following operation has particular sensitivities/vulnerabilities:

- `reset-pcep-statistics-all`: The RPC is used to reset all PCEP statistics across all peers and sessions. An unauthorized reset could impact monitoring.

10. IANA Considerations

IANA has registered the following URIs in the "IETF XML Registry" [[RFC3688](#)]:

URI: `urn:ietf:params:xml:ns:yang:ietf-pcep`
Registrant Contact: The IESG
XML: N/A; the requested URI is an XML namespace.

URI: `urn:ietf:params:xml:ns:yang:ietf-pcep-stats`
Registrant Contact: The IESG
XML: N/A; the requested URI is an XML namespace.

IANA has registered the following YANG modules in the "YANG Module Names" registry [[RFC6020](#)]:

Name: `ietf-pcep`
Namespace: `urn:ietf:params:xml:ns:yang:ietf-pcep`
Prefix: `pcep`
Reference: RFC 9826

Name: `ietf-pcep-stats`
Namespace: `urn:ietf:params:xml:ns:yang:ietf-pcep-stats`
Prefix: `pcep-stats`
Reference: RFC 9826

      "source": "192.0.2.2",
      "destination": "192.0.2.5",
      "tunnel-id": 17,
      "lsp-id": 4,
      "extended-tunnel-id": "0.0.0.0",
      "operational-state": "up",
      "delegated": {
        "enabled": true
      },
      "symbolic-path-name": "iewauhiewauh"
    }
  ]
},
"peers": {
  "peer": [
    {
      "addr": "192.0.2.1",
      "role": "pcc",
      "capabilities": {
        "capability": "active passive"
      },
      "sessions": {
        "session": [
          {
            "initiator": "remote",
            "role": "pcc"
          }
        ]
      }
    },
    {
      "addr": "192.0.2.2",
      "role": "pcc",
      "capabilities": {
        "capability": "active passive"
      },
      "sessions": {
        "session": [
          {

```

```
        "initiator": "remote",
        "role": "pcc"
    }
  ]
},
{
  "addr": "2001:db8::4",
  "role": "pcc",
  "capabilities": {
    "capability": "active passive"
  },
  "sessions": {
    "session": [
      {
        "initiator": "remote",
        "role": "pcc"
      }
    ]
  }
}
]
}
```

Similarly, a PCEP session with an IPv6 address between a PCE (2001:db8::3) and a PCC (2001:db8::4) could also be set up.

Appendix C. Design Objectives

This section describes some of the design objectives for the model:

- Existing implementations need to map the data model defined in this document to their proprietary data model. To facilitate such mappings, the data model should be simple.
- The data model should be suitable for new implementations to use as is.
- Mapping to the PCEP MIB module [RFC7420] should be clear.
- The data model should allow for static configurations of peers.
- The data model should include read-only counters in order to gather statistics for sent and received PCEP messages, received messages with errors, and messages that could not be sent due to errors. This could be in a separate model that augments the base data model.
- It should be fairly straightforward to augment the base data model for advanced PCE features.

Appendix D. Relationship with PCEP MIB

If a node implements the PCEP MIB [RFC7420], data nodes from the YANG module can be mapped to table entries in the PCEP MIB.

YANG Data Nodes	PCEP MIB Objects
/pcep/entity	PcePcepEntityEntry
/pcep/entity/peers/peer	pcePcepPeerEntry
/pcep/entity/peers/peer/sessions/session	pcePcepSessEntry

Table 3: High-Level Relationship with PCEP MIB

YANG Data Nodes	PCEP MIB Objects
-	pcePcepEntityIndex
admin-status	pcePcepEntityAdminStatus
oper-status	pcePcepEntityOperStatus
addr	pcePcepEntityAddrType, pcePcepEntityAddr
connect-timer	pcePcepEntityConnectTimer
connect-max-retry	pcePcepEntityConnectMaxRetry
init-back-off-timer	pcePcepEntityInitBackoffTimer
max-back-off-timer	pcePcepEntityMaxBackoffTimer
open-wait-timer	pcePcepEntityOpenWaitTimer
keep-wait-timer	pcePcepEntityKeepWaitTimer
keepalive-timer	pcePcepEntityKeepAliveTimer
dead-timer	pcePcepEntityDeadTimer
allow-negotiation	pcePcepEntityAllowNegotiation
max-keepalive-timer	pcePcepEntityMaxKeepAliveTimer
max-dead-timer	pcePcepEntityMaxDeadTimer
min-keepalive-timer	pcePcepEntityMinKeepAliveTimer
min-dead-timer	pcePcepEntityMinDeadTimer
sync-timer	pcePcepEntitySyncTimer
request-timer	pcePcepEntityRequestTimer

YANG Data Nodes	PCEP MIB Objects
max-sessions	pcePcepEntityMaxSessions
max-unknown-reqs	pcePcepEntityMaxUnknownReqs
max-unknown-msgs	pcePcepEntityMaxUnknownMsgs

Table 4: Relationship with PCEP MIB for Entity
